ABSTRACTED-PUB-NO: DE 4203512C

BASIC-ABSTRACT:

Car door window drive comprises motor powered raiser and a control having a service switch (lifter switch) inside the vehicle for lift/lower modes plus an additional switch with timing circuit. The additional switch should consist of a gripper switch operated from outside by the outside door handle (10, 2). The gripper switch is used to switch in the "window down" function via the associated time circuit and a release switch operated by the door lock in a case where the lock has been released and the release switch operated. Thus the handle (10) and gripper switch are operated after a pre-set delay time via the timing circuit.\$

ADVANTAGE - Window lowered via outside handle gripper switch e.g. for tight parking and easy door opening and entry.
